

Get column type schema

[Copy Page](#)

Learn how to read type-specific column settings via the API

Every column type in monday.com has a unique settings schema that defines how the column can be configured — including available properties, their types, constraints, and valid values. The `get_column_type_schema` query lets you retrieve this schema programmatically for any supported column type.

This is especially useful when:

- **Building dynamic integrations** that need to create or configure columns without hardcoding settings for each type
- **Powering AI agents** that need to understand column structure and capabilities to read or write data correctly
- **Validating column settings** before passing them to `create_column` or typed create mutations like `create_status_column`

The returned JSON schema follows the [JSON Schema draft-07](#) specification. It describes the `settings` object for the column type, including property names, types, enums, array constraints, and required fields.

Each column type's documentation page includes a ready-to-use query for retrieving its schema. See the individual [column type reference pages](#) for type-specific examples.

Queries

Get column type schema

- Returns a JSON schema object defining the settings structure for a specific column type
- Can only be queried directly at the root; can't be nested within another query

GraphQL JSON

```
query {  
  get_column_type_schema(  
    type: String!  
  ) {  
    settings {  
      type: String!  
      constraints {  
        type: String!  
        value: String!  
      }  
      validValues {  
        type: String!  
        value: String!  
      }  
    }  
  }  
}
```

Need help? Ask AI!

```
    type: board_relation
  )
}
```

Arguments

Argument	Type	Description
type	ColumnType!	The type of column to retrieve the schema for.

More examples

Status column

The status column schema reveals the full label configuration structure, including color enums, maximum label count, and which fields are required.

GraphQL JSON

```
query {
  get_column_type_schema(
    type: status
  )
}
```

Date column

The date column schema shows available display and formatting options.

GraphQL JSON

```
query {
  get_column_type_schema(
    type: date
  )
}
```

Reading the schema

The response is a standard JSON Schema object. Here's how to interpret the key parts:

Schema Property	What It Tells You
properties	The available settings fields and their structure

Schema Property	What It Tells You
type	The expected data type (<code>string</code> , <code>boolean</code> , <code>integer</code> , <code>array</code> , <code>object</code>)
enum	A fixed set of allowed values (e.g., color names, calculation types)
required	Fields that must be provided when creating or configuring the column
maxItems	The maximum number of elements in an array (e.g., 40 labels for status)
maxLength	The maximum character length for a string (e.g., 30 characters for status labels)
additionalProperties	Whether extra fields beyond those listed are allowed (<code>false</code> = strict)
description	A human-readable explanation of what the field does

Supported column types

You can pass any of the following [ColumnType](#) values to the `type` argument:

Column Type Enum	Column Name
auto_number	Auto Number
board_relation	Connect Boards
button	Button
checkbox	Checkbox
color_picker	Color Picker
country	Country
creation_log	Creation Log
date	Date
dependency	Dependency
doc	monday doc
dropdown	Dropdown
email	Email
file	Files

Column Type Enum	Column Name
formula	Formula
hour	Hour
item_id	Item ID
last_updated	Last Updated
link	Link
location	Location
long_text	Long Text
mirror	Mirror
name	Name
numbers	Numbers
people	People
phone	Phone
progress	Progress Tracking
rating	Rating
status	Status
tags	Tags
text	Text
time_tracking	Time Tracking
timeline	Timeline
vote	Vote
week	Week
world_clock	World Clock
